

How to Create a GitHub Account and Generate a Personal Access Token

Part 1: Creating a GitHub Account

Step 1:

Open your browser and head over to <https://github.com/>. You will see the GitHub homepage with a large heading and an email field in the center of the page. This is where you start the sign-up process.

Step 2: Enter your email address

Type your email address into the "Enter your email" field on the homepage. Once you have typed it in, click the green "Sign up for GitHub" button right next to it. This will take you to the registration form.

Step 3: Fill out the sign-up form

You will now see a registration form asking for a few details. Your email will already be filled in from the previous step. You need to set a password (at least 15 characters, or at least 8 characters with a number and a lowercase letter). Then pick a username. This will be your identity on GitHub, so choose something you are comfortable with. Usernames can only have letters, numbers, or single hyphens. Finally, select your country from the dropdown.

The image shows the GitHub account creation form. On the left is a dark blue sidebar with the text "Create your free account" and "Explore GitHub's core features for individuals and organizations." The main form area is white. At the top right, it says "Already have an account? Sign in". The form is titled "Sign up for GitHub". It has two buttons: "Continue with Google" and "Continue with Apple". Below these is an "Email" field with "gl.us.learning@gmail.com" entered. Then a "Password" field with a note: "Password should be at least 15 characters OR at least 8 characters including a number and a lowercase letter." Below that is a "Username" field with a note: "Username may only contain alphanumeric characters or single hyphens, and cannot begin or end with a hyphen." Then a "Your Country/Region" dropdown menu with "India" selected. Below that is a section for "GitHub Copilot" with a checked box for "Sign up for Copilot Free for coding assistance on the web, in the IDE, and in the CLI." and a link to "See terms". Then an "Email preferences" section with an unchecked box for "Receive occasional product updates and announcements". At the bottom is a green "Create account" button. At the very bottom, there's a small disclaimer: "By creating an account, you agree to the Terms of Service. For more information about GitHub's privacy practices, see the GitHub Privacy Statement. We'll occasionally send you account-related emails."

Here is what the form looks like once everything is filled in. Once everything looks good, click the green "Create account" button at the bottom.

[Create account](#)

By creating an account, you agree to the [Terms of Service](#). For more information about GitHub's privacy practices, see the [GitHub Privacy Statement](#). We'll occasionally send you account-related emails.

Step 4: Verify your email address

GitHub will send a verification code to the email address you provided. Go check your inbox for an email from GitHub. It will contain a six-digit code. Come back to this page and type in that code, then click "Continue". If you do not see the email, check your spam folder. You can also click "Resend the code" if needed.

Step 6: Welcome to the GitHub Dashboard

After signing in, you will land on your GitHub Dashboard. This is your home base. You will see options to create your first project, import a repository, and a "Getting started" checklist. Do not worry about any of that right now. Your account is ready to go.

Part 2: Generating a Personal Access Token

A Personal Access Token (PAT) is like a special password that lets you interact with GitHub from outside the website. You will need this token later if you want to programmatically push files to GitHub. Let us set one up now so it is ready when you need it.

Step 7: Open your account Settings

From the Dashboard, click on your profile picture in the top right corner of the page. A dropdown menu will appear. Click on "Settings" from this menu.

Step 8: Navigate to Developer Settings

You will land on the Settings page, which shows your Public Profile. On the left sidebar, you will see a bunch of options like Account, Appearance, Notifications, and so on. Scroll all the way down to the very bottom of this sidebar.

At the bottom of the sidebar, you will find "Developer settings" as the last item. Click on it. This is where all the token and app related settings live.

Step 9: Go to Personal Access Tokens

You will now see the Developer Settings page. On the left sidebar, you will see three options: GitHub Apps, OAuth Apps, and Personal access tokens. Click on "Personal access tokens" to expand it.

Once you expand Personal access tokens, you will see two sub-options: Fine-grained tokens and Tokens (classic). Click on "Tokens (classic)". Classic tokens are simpler to set up and work well for general use cases.

Step 10: Generate a new token

On the Tokens (classic) page, you will see a message saying no personal access tokens have been created yet. Click the "Generate new token" dropdown button, and then select "Generate new token (classic)" from the options that appear.

Step 11: Configure the token

Now you need to fill in the details for your new token. In the "Note" field, give your token a descriptive name so you remember what it is for later. In this example, we are using "Model Deployment" as the note. Next, set the expiration. You can choose 30 days, 60 days, 90 days, or a custom date. For this example, we are going with 30 days.

Under "Select scopes", you need to check the boxes for the permissions your token should have. For pushing files to a repository, you will need the "repo" scope at minimum. Check the "repo" checkbox, which gives full control of private repositories (it automatically includes sub-permissions like repo:status, repo_deployment, public_repo, repo:invite, and security_events).

If you scroll down, you will see more scope options like workflow, packages, admin:org, and others. For now, you do not need to check any of these. Just make sure "repo" is selected. Once you are done, click the green "Generate token" button at the very bottom of the page.

☐ useremail	Access user email addresses (read-only)
☐ userfollow	Follow and unfollow users
☐ delete_repo	Delete repositories
☐ write:discussion	Read and write team discussions
☐ read:discussion	Read team discussions
☐ admin:enterprise	Full control of enterprises
☐ manage_runners:enterprise	Manage enterprise runners and runner groups
☐ manage_billing:enterprise	Read and write enterprise billing data
☐ read:enterprise	Read enterprise profile data
☐ scim:enterprise	Provisioning of users and groups via SCIM
☐ audit_log	Full control of audit log
☐ read:audit_log	Read access of audit log
☐ codespace	Full control of codespaces
☐ codespace:secrets	Ability to create, read, update, and delete codespace secrets
☐ copilot	Full control of GitHub Copilot settings and seat assignments
☐ manage_billing:copilot	View and edit Copilot Business seat assignments
☐ write:network_configurations	Write org hosted compute network configurations
☐ read:network_configurations	Read org hosted compute network configurations
☐ project	Full control of projects
☐ read:project	Read access of projects
☐ admin:gpg_key	Full control of public user GPG keys
☐ write:gpg_key	Write public user GPG keys
☐ read:gpg_key	Read public user GPG keys
☐ admin:ssh_signing_key	Full control of public user SSH signing keys
☐ write:ssh_signing_key	Write public user SSH signing keys
☐ read:ssh_signing_key	Read public user SSH signing keys

[Generate token](#) [Cancel](#)

Step 12: Copy and save your token

Your token has been generated. You will see it displayed on the screen with a green checkmark next to it. This is extremely important: copy this token right now and save it somewhere safe. GitHub will only show you this token once. If you leave this page without copying it, you will never be able to see it again and you will have to generate a new one.

Click the clipboard icon next to the token to copy it. Then paste it into a secure location like a password manager, a private note, or a text file on your computer. Do not share this token with anyone, as it provides access to your GitHub account.

That is it. You now have a GitHub account and a Personal Access Token ready to use. Remember, the token works like a password, so keep it safe. If it ever gets compromised or expires, you can always come back to Developer Settings and generate a new one. When the time comes to push files to GitHub programmatically, you will use this token to authenticate instead of your regular password.
